# Getting started

Welcome to the *Dragon Professional Anywhere Installation and Administration Guide*.

## Setting up a working system

The following steps are required to set up a working Dragon Professional Anywhere system:

1. Make sure you fulfill all software and hardware requirements. For more information, see: [Software and hardware requirements](#) and [Deploying in a virtual environment](#).
2. Make sure you have a working installation of Dragon Medical Server and that your firewall doesn't block the port Dragon Professional Anywhere uses to access the speech recognition server. For more information, see the *Dragon Medical Server Installation Guide* and the *Dragon Medical Server Administration Guide*.
3. Make sure you have a working installation of the Nuance Management Server (NMS). For more information, see the documentation delivered with the product.
4. Dragon Professional Anywhere requires direct access to NMS via an external URL (visible to the workstation or server running the Dragon Professional Anywhere client). For more information on the external NMS URL, see the *Dragon Medical Server Installation Guide* and the *Dragon Medical Server Administration Guide*.
5. [Deploy](#) Dragon Professional Anywhere.
6. Configure Dragon Professional Anywhere via the app configuration file (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package). The following configurations are mandatory:

[Dragon Medical Server URL](#)  
[Organization token](#)  
[Language](#)  
[Speech recognition topic](#)

## Customizing the system to your needs

Dragon Professional Anywhere offers a wide range of options to customize the system to your users' needs. The following customization options are available:

- [Providing different configurations for a single standalone deployment](#)
- [Configuring the default options](#)
- [Enabling Basic Text Control](#)
- [Configuring timeout for end users](#)
- [Configuring microphones](#)
- [Disabling the crash dump notification to end users](#)
- [Disabling registration of the Microsoft Word add-in](#)
- [Customizing the splash screen](#)
- [Configuring the user interface color theme](#)
- [Configuring the user authentication](#)
- [Configuring logging](#)
- [Defining auto-texts](#)
- [Configuring step-by-step commands](#)
- [Enabling and disabling WPF support](#)

# Software and hardware requirements

Dragon Professional Anywhere supports the following hardware and software.

Be aware that not all configurations have been tested. For more information, contact Nuance Technical Support.

## Operating systems

- 32-bit: Microsoft Windows 10. Make sure that the latest service pack is always applied.
- 64-bit: Microsoft Windows 10, Windows 11, Windows Server 2016 and Windows Server 2019. Make sure that the latest service pack is always applied.

Microsoft .NET Framework 4.7.2 (or higher) is required.

In Microsoft Windows 10 and 11, you can only use Dragon Professional Anywhere in the desktop environment, the Microsoft design language-based user interface (Start screen) is not supported.

## Processor speed

- Minimum: 1.7 Ghz
- Recommended: 2.8 Ghz

## RAM

- Minimum: 512 MB
- Recommended: 2 GB

## Microphones

Any microphone that can record audio data in 16 kHz, 16 bit mono format.

Nuance has tested and recommends the following microphones:

- Nuance PowerMic II, III and 4
- Philips SpeechMike Air, Philips SpeechMike Premium, Philips SpeechMike III
- Grundig Digta SonicMic II and 3, Grundig Digta CordEx, Grundig Digta 7

To work with Dragon Professional Anywhere in hands-free mode, using a foot pedal in combination with a microphone, you must make changes to the registry on your workstation. If you are working in a virtual environment, you must modify the registry settings on the virtual server for every Windows user that will be used to run Dragon Professional Anywhere. For more information, contact Nuance Technical Support.

## Web browsers

For access to Nuance Management Center (NMC):

- Microsoft Edge, Google Chrome, Apple Safari

For the personalization and help window:

- Microsoft Edge WebView2. Install the Microsoft Edge WebView2 Evergreen Standalone component; for more information, see [WebView2 - Microsoft Edge Developer](#).

## Text editors

The following text editors are supported:

- TX Text Control .NET for Windows Forms 10.0 - X15 and 30.0
- Microsoft Word 2007, 2010 and 2016
- Microsoft Rich Text controls (including .NET Forms)
- Ter32, Ter13-Ter17 and Ter21-Ter23
- TEdit (for 32-bit apps), TMemor (for 32-bit apps) and TRichEdit (for 32-bit and 64-bit apps)
- WPF standard text controls  
Restrictions: Speech focus anchoring is not supported.
- TX Text Control .NET for WPF X15, X17 and X18 supported via Microsoft UI Automation  
Restrictions: Text formatting can only be applied via standard keyboard shortcuts (for example, **Ctrl + B**) and depends on the capabilities of the integrating app; speech focus anchoring is not supported for TX Text Control .NET for WPF X15.

## Virtualized environments

For information on supported virtualized environments, see: [Deploying Dragon Professional Anywhere in a virtualized environment](#).

## End-of-life: Third-party environments

Support for third-party environments is only valid as long as they're supported by the corresponding vendor and might be subject to other restrictions. Contact Nuance Technical Support for details. For more information, see the documentation delivered with the third-party product and supporting Nuance documentation.

When standard support by the vendor has stopped, Nuance continue support if an issue is specific to the Nuance solution, within the limitations of the vendor's standard end-of-life and Nuance's policy. This means that issues that are a combination of the vendor's component and the Nuance solution can't be supported.

# Deploying Dragon Professional Anywhere

The following options are available to deploy Dragon Professional Anywhere:

- Deploy Dragon Professional Anywhere [using the Windows Installer](#) (MSI package).
- Deploy Dragon Professional Anywhere via [XCOPY deployment](#) (manually copy the package to the destination path).

For information on how to deploy Dragon Professional Anywhere in a virtual desktop/application environment, see: [Deploying in a virtual environment](#).

## Deployment recommendations

- We recommend deploying Dragon Professional Anywhere to a local folder. During runtime, Dragon Professional Anywhere frequently accesses files that are part of the deployment; loading those files from a network share would have a severe impact on performance.
- Make sure the app configuration file has the same version as the app; don't use an old configuration file when you update to a newer version of Dragon Professional Anywhere. The version number can be found in the first line in the app configuration file.

To keep your customized settings after an upgrade, save the existing app configuration file before you upgrade and then manually transfer the respective settings, or create an XML file containing your customized settings and start Dragon Professional Anywhere from the [command line](#), specifying the path to this XML file via the `config` parameter. For more information, see: [Providing different configurations for a single standalone deployment](#).

## The Windows Installer

The MSI package provided is command line-only; no installation wizard is available.

To customize the installation, set all mandatory parameters and any optional parameters you want, or use the [CONFIGTEMPLATE parameter](#) to deploy a configuration file containing all relevant settings (this is the recommended option). Values for parameters must be in double quotes.

Application binaries are by default installed to the following location: **C:\Program Files (x86)\Nuance\Dragon Professional Anywhere**

Dragon Professional Anywhere isn't automatically added to the Microsoft Windows Start menu; to add it manually, use the SoD.exe file.

To support uninstallation, an entry is automatically created in the **Control Panel, Programs and Features** window.

## Mandatory parameters

- **SERVERURL**

The full URL for your Dragon Medical Server deployment; for more information, see: [Configuring Dragon Professional Anywhere](#).

- **ORGANIZATIONTOKEN**

The organization token assigned to the organization you are deploying to.

- **SUPPORTEDLANGUAGES**

A list of languages (as IETF language tags) that the end user can select from in the logon dialog box. Separate values with the pipe character: |

For more information, see [Supported languages](#) and [Configuring Dragon Professional Anywhere](#).

- **SUPPORTEDTOPICS**

A list of speech recognition topics that the end user can select from in the logon dialog box. Separate values with the pipe character: |

For more information, see: [Configuring the speech recognition topic](#).

## Optional parameters

- **CONFIGTEMPLATE**

The full path to the configuration file containing all relevant settings. If this parameter is specified, all other command line parameters provided by Dragon Professional Anywhere are ignored (you can still use OEMSPASHSCREEN and INSTALLDIR).

For more information, see [Configuring Dragon Professional Anywhere](#).

- **INSTALLDIR**

The deployment location. If this parameter isn't set, the [default location](#) is used.

- **OEMSPASHSCREEN**

The custom splash screen overlay. The specified file is copied to the deployment location. Required size: 320x130 pixels; required format: PNG.

- AUTHENTICATION

The user authentication type; for more information, see: [User authentication](#).

- LOGFILEPATH

The location of the log file. To prevent environment variables from being expanded when the setup is executed, the percent sign must be escaped by the ^ character and no quotes must be used; for example, ^%APPDATA^%.

For more information, see: [Logging](#).

- LOGLEVEL

The log level; for more information, see: [Logging](#).

- ALLOWEDMICS

A list of microphones the end user is allowed to use. Separate values with the pipe character: |

For more information, see: [Configuring Dragon Professional Anywhere](#).

- WPF SUPPORT

Enables/disables support for standard WPF text controls. Possible values: Yes, No. If this parameter isn't set, the feature is disabled by default.

For more information, see: [Enabling and disabling WPF support from the command line](#).

## Examples

```
msiexec /i Standalone.msi SERVERURL="https://<server_name>/nmhtml"  
ORGANIZATIONTOKEN="your_organization_token" SUPPORTEDLANGUAGES="en-US|en-GB"  
SUPPORTEDTOPICS="GeneralDictation"
```

```
msiexec /i Standalone.msi CONFIGTEMPLATE="C:\<path>\SoD.exe.config"  
OEMSPLASHSCREEN=".\\SoD.OEM.png"
```

## XCOPY deployment

To deploy Dragon Professional Anywhere using XCOPY, do the following:

1. Download the installation package.
2. Depending on your Group Policy security settings, Microsoft Windows marks downloaded files as unsafe. Unblock the downloaded ZIP file, if necessary, to allow .NET to execute

properly when the app is started: Select and hold (or right-click) the ZIP file and select **Properties > General > Unblock > Apply**.

3. Extract all files.
4. Customize the SoD.exe.config file template to configure Dragon Professional Anywhere. For more information, see: [Configuring Dragon Professional Anywhere](#).
5. Make the **Standalone** folder available to your end users.

**Note:** Dragon Professional Anywhere isn't automatically added to the Microsoft Windows Start menu; to add it manually, use the SoD.exe file.

## Upgrading using XCOPY

When an upgrade package is available, be sure to make it available to your end users.

# Deploying Dragon Professional Anywhere in a virtualized environment

Dragon Professional Anywhere can be deployed as a virtualized application or on a virtual desktop. The speech recognition is performed on your secure server; Dragon Professional Anywhere has a small resource footprint on the application/desktop virtualization server.

## Supported virtualized environments

Dragon Professional Anywhere can be deployed in Citrix XenApp/XenDesktop, Microsoft Remote Desktop Services (RDS) and VMware Horizon View/RDSH virtualized environments. For more information on supported virtualized environments, see the Dragon Professional Anywhere release notes.

**Important:** For security reasons, make sure that VDI channel encryption is enabled between client end points and VDI servers or virtual desktops. Disabling encryption in a virtualized environment can lead to confidential data being exposed. Encryption is enabled by default.

## Edit control visibility

To write recognized text directly in the target app (instead of the Dictation Box), Dragon Professional Anywhere must be able to directly access the app's edit controls. To enable this, Dragon Professional Anywhere must be co-installed and published with the target app.

This means the following:

- If you are using a virtual desktop solution, where all target apps are installed and run locally in the virtual desktop, Dragon Professional Anywhere must be installed in the virtual desktop image.
- If you are virtualizing applications that are accessed by a viewer or remote desktop application on a local workstation, make sure that Dragon Professional Anywhere and the virtualized applications are launched in the same remote session.

## Nuance virtual extensions

High quality audio is required for accurate speech recognition. Regardless of the virtualization technology and architecture, you must be able to deliver audio from the client workstation/terminal to the Dragon Professional Anywhere app in the virtual environment.

The Nuance virtual extensions package provides custom audio channels to reduce the audio bandwidth requirements between the client end point and the virtualized application. The custom audio channels require 28 kbit/s for each user while they're dictating (native audio channels often require up to 1.4 Mbit/s).

**Citrix, RDS and VMware environments:** Dragon Professional Anywhere already integrates the server/virtual desktop component of the Citrix, RDS and VMware audio channels. Install the Nuance Citrix Client Audio Extension, Nuance RDS Client Audio Extension or Nuance VMware Client Audio Extension on the client PC.

**Note:** If the Nuance Citrix Server & Virtual Desktop Audio Extension is installed, we recommend you uninstall it unless it is still used by another product.

To allow the usage of Nuance audio channels in Citrix environments, you must update the Citrix policy settings. For more information, see the documentation included in the Nuance virtual extensions package.

## Thin clients

To use the custom audio channel in a thin client environment, the client component of the corresponding Nuance virtual extension must be installed on the thin client. For more information on supported thin clients, see the Dragon Professional Anywhere release notes.

## Backward compatibility

The server/virtual desktop components of the Nuance virtual extensions are integrated in Dragon Professional Anywhere. The Nuance virtual extensions are designed to be backward-compatible from Dragon Professional Anywhere to the client end point. This means that you can run newer versions of Dragon Professional Anywhere in your virtual environment and they work with older versions of the corresponding client end point extension with the following restrictions:

- New versions of Dragon Professional Anywhere are backward-compatible with the corresponding end point virtual extensions for up to one year.
- It is recommended to upgrade the client end point extension to the latest version.

## Microphone controls

The Nuance virtual extensions package provides custom PowerMic control channels to redirect PowerMic button presses to the virtualized Dragon Professional Anywhere instance.

**Citrix, RDS and VMware environments:** Dragon Professional Anywhere already integrates the server/virtual desktop component of the PowerMic button channel. Install Nuance PowerMic Citrix Client Extension, Nuance PowerMic RDS Client Extension or Nuance PowerMic VMware Client Extension on the client PC.

**Note:** If the Nuance PowerMic Citrix Server & Virtual Desktop Extension is installed, we recommend you uninstall it unless it is still used by another product.

Redistributable packages for Philips and Grundig devices are also available.

For more information, see the documentation included in the Nuance virtual extensions package.

## Server runtime requirements

### Bandwidth

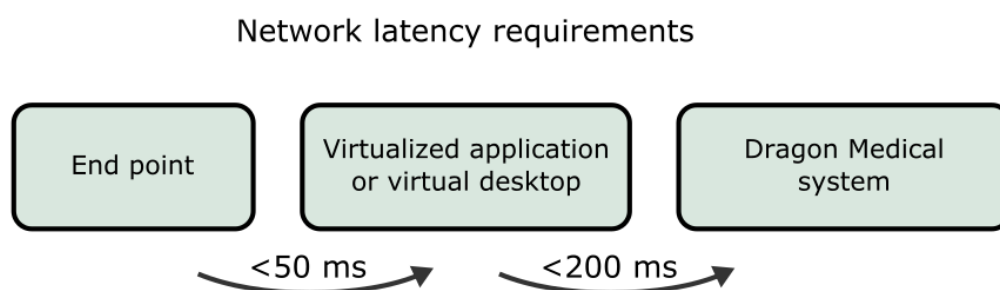

Audio transmission between the end point and the virtualized application/virtual desktop: If the Nuance custom audio channel is used, expect 28 kbit/s per active user; if the native virtual audio channel is used, expect up to 1.4 Mbit/s per active user.

Audio transmission between the virtualized application/virtual desktop and the servers hosting Dragon Medical Server: Expect 80 kbit/s per active user.

## Latency

Network latency between the client PC and the virtualized application/virtual desktop must not exceed 50 ms.

Network latency between the virtualized application/virtual desktop and the Dragon Medical system must not exceed 200 ms.

## Memory

The Dragon Professional Anywhere app's memory usage, when in use, will fluctuate (based on user behavior and Microsoft Windows memory management behavior). For sizing and planning purposes we estimate memory utilization of 220 MB (full working set), of which approximately 70 MB (shared working set) are shared between all instances of the SoD.exe process on the same machine – the real physical memory impact therefore is approximately 150 MB per instance.

## CPU

Due to the many factors that can have an impact on CPU usage (processor speed, number of cores assigned to a given virtual instance, etc.), exact guidelines can't be given. In general, the CPU requirements for the virtualized sod.exe executable are very low. As Dragon Professional Anywhere leverages speech recognition services, the local client performs very light-weight duties such as streaming speech and inserting recognition results.

With modern multi-core CPU architecture and provided that a given virtual session has been assigned at least one core, Dragon Professional Anywhere consumes between 1% and 3% of the available CPU per user session while the user is dictating.

## Deployment options

The following options are available to deploy Dragon Professional Anywhere in a virtual desktop/application environment:

- Deploy Dragon Professional Anywhere using the [Windows Installer](#) (MSI package).
- Deploy Dragon Professional Anywhere via [XCOPY deployment](#) (manually copy the package to the destination path).

## Logging

In a virtual desktop/application environment, we recommend configuring a user-specific folder as the log file location; for example, %APPDATA%.

If you deploy Dragon Professional Anywhere using the Windows Installer, you can specify the location of the log file via the LOGFILEPATH parameter. For more information, see: [Windows Installer](#).

If you deploy Dragon Professional Anywhere via XCOPY deployment, you can specify the location of the log file in the log4net section of the SoD.exe.config file (use the following syntax to specify environment variables: \${APPDATA}):

```
<appender name="TheSoDAppender" type="log4net.Appender.RollingFileAppender">  
  <param name="File" value="${APPDATA}\SoD.log"/>
```

For more information, see: [Logging](#).

# Coherence mode

Dragon Professional Anywhere is designed to work in a virtualized environment, which significantly lowers administration overhead for installation and maintenance. Additionally, virtual deployments increase the availability of the app as users can access Dragon Professional Anywhere from any secure end point (office or home).

Dragon Professional Anywhere can also be installed locally on a Windows desktop using either an XCOPY installer or a traditional MSI. This is necessary when users need to record into locally installed apps such as Microsoft Word, Microsoft Outlook or an app that is deployed as a fat client.

Occasionally, users want to work both locally and virtually. They use a published version of Dragon Professional Anywhere to record into a published app and a local version of Dragon Professional Anywhere to dictate into local apps.

**Note:** Coherence mode is only supported in Citrix virtualization environments.

## Scenario

The user wants to record into the primary virtual application and into apps that are published locally.

## Prerequisites

- The primary app is hosted as a virtual application or published as a virtual application.
- Dragon Professional Anywhere is published in the same way as the primary app (as a virtual application or as part of the virtual desktop image).
- The end point used to access the virtual applications is a desktop machine running a supported Microsoft Windows operating system (for information on supported operating systems, see: [Software and hardware requirements](#)).

## Procedure

1. Install Dragon Professional Anywhere on the server.
2. Install the technology-specific custom audio and microphone channels on the server.
3. Install the corresponding technology-specific custom audio and microphone channels on all client end points.
4. Install Dragon Professional Anywhere on the local workstation, using either the XCOPY or MSI installation package.

## Remarks

- Local installations don't use the custom audio or microphone drivers, therefore there is no conflict.

## Results

Since profiles are stored on the server, users have an identical speech experience, regardless of whether they're using the local app or the published instance. All the auto-texts, commands, custom words and app configuration parameters are consistent across both instances.

**Note:** For performance reasons, each instance of Dragon Professional Anywhere maintains a cache of auto-texts, custom words and commands. If a user adds a word, auto-text or command in one instance, it will be available in the second instance when that cache is refreshed (by closing and running that instance).

When a user only has one instance of Dragon Professional Anywhere running at a particular moment but not both at the same time, there are no usability concerns.

## Running both instances

If a user is running both the local and published instances concurrently and wants to dictate into local and published apps, consider the following good practice:

- To visually differentiate the local and virtual instances of Dragon Professional Anywhere, we recommend [setting a different color theme](#) for each instance.
- To switch the audio and device button focus between instances, users must select the  icon on the corresponding DragonBar. Once an instance has the audio focus, users can continue to use their hardware microphone to control the app as normal.

**Note:** When using Nuance PowerMic II or PowerMic III as an input device, users can automatically switch the audio and device button focus from a local instance to a published one by placing the cursor in the corresponding local or published app.

# Using Dragon Professional Anywhere with Mac

Dragon Professional Anywhere is a native Windows app; it cannot be installed and used directly on a macOS-based computer. Dragon Professional Anywhere can be configured for use with macOS.

## Running Windows on macOS

A user can run a full instance of a Windows operating system on a macOS-based computer via virtual machine solutions such as [Parallels Desktops for Mac](#) or [VMware Fusion](#). These solutions allow using Windows and macOS apps side-by-side.

Dragon Professional Anywhere must be installed on a Windows virtual machine. This configuration is identical to Dragon Professional Anywhere installed on a native Windows machine and provides full functionality with the following conditions:

- Dictation at the cursor isn't supported in native macOS apps. To fully support this functionality, Dragon Professional Anywhere requires a deep integration with target apps; this level of integration isn't possible with native macOS apps. Dictating into the Dictation Box and then transferring text to macOS apps might be possible; however, this configuration isn't officially supported by Nuance.
- Hardware microphone "pass-through" must be supported by the virtualization solution. This allows the hardware device to be recognized by the Windows operating system and made available to Dragon Professional Anywhere.

## Running Windows in native mode on Mac hardware

A user can run a Windows operating system on a macOS-based computer via [Boot Camp](#). Boot Camp eliminates the virtual machine layer introduced by virtual machine solutions such as Parallels.

# Web browser support

Dragon Professional Anywhere supports dictation at the cursor in standard text controls (these include text input, text area and standard content-editable controls) hosted in Google Chrome.

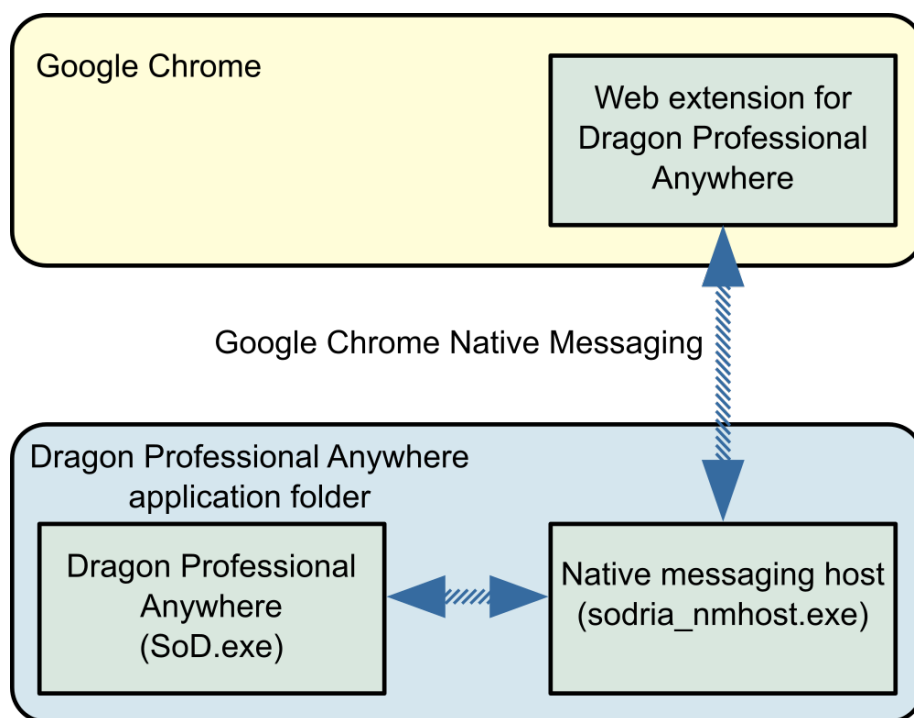

To support text controls and dictation at the cursor in apps based on Google Chrome, you must install the corresponding web extension for Dragon Professional Anywhere.

## Architecture

Dragon Professional Anywhere and the web extension for Dragon Professional Anywhere use a dedicated process (`sodria_nmhost.exe`) for communication between Dragon Professional Anywhere and the browser. This process is delivered with Dragon Professional Anywhere and is started by the browser. Google Chrome and Dragon Professional Anywhere rely on one of the following registry keys to connect the two apps:

- `HKEY_CURRENT_USER\Software\Google\Chrome\NativeMessagingHosts\com.nuance.sodria` (written by Dragon Professional Anywhere to register the gateway)
- `HKEY_LOCAL_MACHINE\Software\Google\Chrome\NativeMessagingHosts\com.nuance.sodria` (written by the Dragon Professional Anywhere MSI installer to register the gateway)

Dragon Professional Anywhere automatically creates and updates the registry key to connect the two processes while starting; this is usually only needed once per deployment and operating system user.

## Installing the web extension for Google Chrome

The web extension for Dragon Professional Anywhere must be installed for each machine and operating system user using Google Chrome. Once the extension is installed, the browser must be restarted (or tabs reloaded).

### Installing the web extension via Google Chrome web store

To install manually, do the following:

1. Browse for the web store link to the extension: [Dragon \(DMO, DMD, DPA, DLA\) Web Extension](#)
2. Select **Add to Chrome**.
3. In Google Chrome, open the **Settings** menu and select **Extensions**.
4. Search for "Dragon (DMO, DMD, DPA, DLA) Web Extension" and make sure that the extension is enabled.
5. Select **Details > Site access > On all sites**.
6. Restart the Google Chrome browser.

## Installing the web extension via Google Chrome policies

To install automatically, do the following:

1. Open the LOCAL\_MACHINE registry hive.
2. Add the following to the registry:  
Key: HKEY\_LOCAL\_MACHINE\SOFTWARE\Policies\Google\Chrome\ExtensionInstallForcelist\1  
Value:  
feolagkacappiaieohahjkeaikhjjcfa;https://clients2.google.com/service/update2/crx
3. Restart the Google Chrome browser.

For more information on automatic installation, see [Google Chrome policy documentation](#).

## Enabling dictation at the cursor in local HTML pages

To enable dictation at the cursor in HTML pages stored in the local file system, do the following:

1. In Google Chrome, open the **Settings** menu and select **Extensions**.
2. Search for "Dragon (DMO, DMD, DPA, DLA) Web Extension", select **Details** and enable the **Allow access to file URLs** setting.

# Configuring Dragon Professional Anywhere

Make sure the app configuration file has the same version as the app; don't use an old configuration file when you update to a newer version of Dragon Professional Anywhere. The version number can be found in the first line in the app configuration file.

To keep your customized settings after an upgrade, save the existing app configuration file before you upgrade and then manually transfer the respective settings, or create an XML file containing your customized settings and start Dragon Professional Anywhere from the [command line](#), specifying the path to this XML file via the `config` parameter. For more information, see: [Providing different configurations for a single standalone deployment](#).

## Configuring the Dragon Medical Server URL

Dragon Professional Anywhere must be configured to be able to connect to your speech recognition server. Proceed as follows:

1. Open the app configuration file that the app should use (for example, `SoD.exe.configuration` on your web server or `SoD.exe.config` for the standalone package).
2. In the **SoD.Settings**, **ServerURL** setting, specify the Dragon Medical Recognition Service URL.

Example: `https://your.dragonmedicalserver.com:1234/basic?mode=1`

**Note:** In the example above, the text in bold is mandatory.

## Configuring the organization token

To set the organization token for Dragon Professional Anywhere, do the following:

1. Open the app configuration file that the app should use (for example, `SoD.exe.configuration` on your web server or `SoD.exe.config` for the standalone package).
2. In the **SoD.Settings**, **OrganizationToken** setting, specify the organization token.

## Providing different configurations for a single standalone deployment

To provide a single standalone package of Dragon Professional Anywhere to different user groups using different configuration settings, do the following:

1. Deploy Dragon Professional Anywhere [using the Windows Installer](#) (MSI package) or via [XCOPY deployment](#).
2. Create a new XML file containing only the configuration settings that are different from the settings in the SoD.exe.config file.
3. Start Dragon Professional Anywhere from the [command line](#) and use the `config` parameter to specify the path to this XML file. The settings in this file override the settings specified in the SoD.exe.config file.

### Remarks

- For a list of **setting** elements you can specify, see the **SoD.Settings** section in the SoD.exe.config file. The elements must be stated exactly as they're in the SoD.exe.config file.

The **setting** elements that you add to the **SoD.DefaultOptions** section override the default settings.

For example (mandatory XML elements and structure in bold):

```
<?xml version="1.0" encoding="utf-8" ?>
<applicationSettings>
  <SoD.Settings>
    <setting name="Authentication" serializeAs="String">
      <value>native</value>
    </setting>
  </SoD.Settings>
  <SoD.DefaultOptions>
    <setting name="Microphone.Record" serializeAs="String"
      isLocked="True">
      <value>Toggle</value>
    </setting>
  </SoD.DefaultOptions>
</applicationSettings>
```

- Dragon Professional Anywhere accesses the XML file during startup; hosting the file on a network share can impact startup performance.

## Configuring the default options

Dragon Professional Anywhere enables you to configure the default settings that the user logs on with. By default, the user can change all settings in the **Options** dialog box; you can lock specific settings to prevent the user from changing them.

You can configure default options via the Nuance Management Center (NMC) or via the configuration file. Options configured via the configuration file overwrite options configured via NMC.

### Configuring default options via NMC

Proceed as follows:

1. Log on to NMC with your administration credentials.
2. On the **Dragon Professional Anywhere** ribbon, select **Manage**.
3. Select an organization, site or group in the tree view.
4. Select a tab and configure a setting.
5. Optional: Select the **Lock** check box to prevent users from changing the configured setting.
6. Select **Save**.

For more information on NMC, select  in the upper right of the NMC page to open the *Nuance Management Center Help*.

### Configuring default options via the configuration file

Proceed as follows:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.DefaultOptions** section, configure the default settings:

Specify the **setting** elements that you want to customize. For a list of setting identifiers and their corresponding values, see the table below.

### Example 1: Locking a setting

In the **setting** element that you want to lock, add the `isLocked` attribute and set the value to `True`.

```
<setting name="Microphone.Record" serializeAs="String" isLocked="True">
  <value>PressAndHold</value>
</setting>
```

### Example 2: Configuring hotkeys

A hotkey value can be specified as a sequence of keys, either separated by spaces and/or plus signs or joined.

```
<setting name="Hotkeys.NextField" serializeAs="String">
  <value>CtrlALTW</value>
</setting>

<setting name="Hotkeys.PreviousField" serializeAs="String">
  <value>Ctrl + ALT + Q</value>
</setting>
```

### Example 3: Defining a hotkey as the default value of a microphone button

Specify the corresponding **setting** element and set the value to `PressHotKey` (key\_sequence).

```
<setting name="Microphone.EnterSelect" serializeAs="String"
isLocked="True">
  <value>PressHotkey (CtrlShiftAltA)</value>
</setting>
```

The following table lists the setting identifiers, their descriptions, possible values and the default values the app is delivered with; the setting identifier has the following format: `OptionCategory.IdentifierName`:

Setting identifier	Setting description
<code>General.AnchorSpeechFocusRecStarted</code>	<p>Determines if the speech focus is anchored when recording is started.</p> <p>Values: <code>True</code>, <code>False</code> (default)</p>
<code>General.VisualFeedbackVoiceCommandsRecognized</code>	<p>Determines if visual feedback is provided when a voice command is recognized and specifies where the voice command bubble is anchored.</p> <p>Values: <code>None</code>, <code>DragonBar</code> (default), <code>Mouse</code>, <code>Text</code>, <code>SystemTray</code></p>

Setting identifier	Setting description
General.AudioFeedbackVoiceCommandsRecognized	<p>Determines if audio feedback is provided when a voice command is recognized.</p> <p>Values: True, False (default)</p>
General.LeftFieldDelimiters	<p>Configures the left embedded field delimiter.</p> <p>Values: [ (default)</p>
General.RightFieldDelimiters	<p>Configures the right embedded field delimiter.</p> <p>Values: ] (default)</p>
General.OptimizeForRapidNavigation	<p>Determines if the text is inserted at the current cursor position when the position of the cursor is changed manually during recording.</p> <p>Values: True, False (default)</p>
DictationBox.UnsupportedControlHandling	<p>Determines if the Dictation Box is opened or if Basic Text Control is used when the cursor is placed in an unsupported text control.</p> <p>Values: DictationBox (default), BasicTextControl</p>
DictationBox.TransferMethod	<p>Configures the text transfer method.</p> <p>Values: ShiftInsert (default), CtrlV, WindowsPaste, SimulateKeystrokes</p>
DictationBox.TransferRecStopped	<p>Determines if the text is transferred from the Dictation Box when recording is stopped.</p> <p>Values: True, False (default)</p>
DictationBox.ClearAfterTransfer	<p>Determines if the transferred text is cleared from the Dictation Box.</p> <p>Values: True (default), False</p>

Setting identifier	Setting description
<code>DictationBox.KeepTextClipboardAfterTransfer</code>	Determines if the transferred text is kept on the clipboard.  Values: True, False (default)
<code>DictationBox.AddTextFromTargetApp</code>	Determines if the text selected in the target app is added to the Dictation Box.  Values: True, False (default)
<code>DictationBox.ShowWhenDragonMinimized</code>	Determines if the Dictation Box is displayed when the DragonBar is minimized.  Values: True (default), False
<code>DictationBox.AudioAlertWhenOpens</code>	Determines if an audio alert is played when the Dictation Box opens automatically.  Values: True, False (default)
<code>DictationBox.TextAppearance</code>	Configures the text appearance.  Values: Plain (default), Formatted
<code>DictationBox.FontType</code>	Configures the font type.  Default value: Arial
<code>DictationBox.FontSize</code>	Configures the font size.  Default value: 10
<code>Hotkeys.ShowHideDragonBar</code>	Configures the hotkeys used to show/hide the DragonBar.  Default value: Ctrl+LTH
<code>Hotkeys.StartStopRecording</code>	Configures the hotkeys used to start/stop recording.  Default value: NUM-Add
<code>Hotkeys.AnchorReleaseSpeechFocus</code>	Configures the hotkeys used to anchor/release the speech focus.

Setting identifier	Setting description
	Default value: CtrlALTA
Hotkeys.ShowHideDictationBox	Configures the hotkeys used to show/hide the Dictation Box.  Default value: CtrlALTD
Hotkeys.TransferText	Configures the hotkeys used to transfer the text from the Dictation Box.  Default value: CtrlALT T
Hotkeys.ClearDictationBox	Configures the hotkeys used to clear the Dictation Box.  Default value: none
Hotkeys.RecallText	Configures the hotkeys used to recall the text.  Default value: none
Hotkeys.PreviousField	Configures the hotkeys used to navigate to the previous field in an auto-text.  Default value: none
Hotkeys.NextField	Configures the hotkeys used to navigate to the next field in an auto-text.  Default value: none
Hotkeys.FieldComplete	Configures the hotkeys used to accept a field's default text.  Default value: none
Hotkeys.AcceptDefaults	Configures the hotkeys used to accept the default text in all fields.  Default value: none
Microphone.Record	Configures the Record button's behavior.  Values: Toggle, PressAndHold (default)
Microphone.Transcribe	Configures the Transcribe button's

Setting identifier	Setting description
	<p>behavior.</p> <p>Nuance PowerMic 4 only: Configures the Rear Function button.</p> <p>Values: none, ClearDictationBox, RecallText, TransferText (default), AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey</p>
Microphone.EnterSelect	<p>Configures the Enter/Select button's behavior.</p> <p>Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults (default), FieldComplete, PressHotkey</p>
Microphone.CustomRight	<p>Configures the Custom Right button's behavior.</p> <p>Nuance PowerMic 4 only: Configures the Function D button's behavior.</p> <p>Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox (default), NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey</p>
Microphone.CustomLeft	<p>Configures the Custom Left button's behavior.</p>

Setting identifier	Setting description
	<p>Nuance PowerMic 4 only: Configures the Function B button's behavior.</p> <p>Values: none (default), ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey</p>
Microphone.FunctionA	<p>Configures the Function A button's behavior on Nuance PowerMic 4.</p> <p>Values: none (default), ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey</p>
Microphone.FunctionC	<p>Configures the Function C button's behavior on Nuance PowerMic 4.</p> <p>Values: none (default), ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey</p>
Microphone.TabBackward	<p>Configures the Tab Backward button's behavior.</p> <p>Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus,</p>

Setting identifier	Setting description
	ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField (default), AcceptDefaults, FieldComplete, PressHotkey
Microphone.TabForward	Configures the Tab Forward button's behavior.  Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField (default), PreviousField, AcceptDefaults, FieldComplete, PressHotkey
Microphone.PlayStop	Configures the Play/Stop button's behavior.  Values: none (default), ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField, AcceptDefaults, FieldComplete, PressHotkey
Microphone.FastForward	Configures the Fast Forward button's behavior.  Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField (default), PreviousField, AcceptDefaults, FieldComplete, PressHotkey
Microphone.FastRewind	Configures the Fast Rewind button's

Setting identifier	Setting description
	<p>behavior.</p> <p>Values: none, ClearDictationBox, RecallText, TransferText, AnchorReleaseSpeechFocus, ShowHideDragonBar, ShowHideDictationBox, NextField, PreviousField (default), AcceptDefaults, FieldComplete, PressHotkey</p>

## Enabling Basic Text Control

By default, if users place the cursor in a text control that isn't fully supported by Dragon Professional Anywhere, the Dictation Box opens automatically and the text is written there. Basic Text Control enables users to dictate at the cursor in unsupported text controls. Only basic speech recognition functionality is supported; users won't be able to navigate, edit or format the text using their voice.

If there are issues with Full Text Control, this configuration setting can also be used to enable Basic Text Control in specific, fully supported text controls.

**Note:** Users can configure Dragon Professional Anywhere via the **Options** dialog box if they prefer to work in the Dictation Box or using Basic Text Control. These settings are overwritten by the settings configured via the configuration file.

To enable Basic Text Control, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, BasicTextControls** setting, specify all text controls (defined as **WindowClass** elements specific to a process) you want to enable Basic Text Control for.

If you don't specify **WindowClass** elements for a process, Basic Text Control is enabled for all window classes of that process.

If you specify a wildcard character (\*) for a process, Basic Text Control is enabled for all specified **WindowClass** elements, independent of the process.

Example:

```
<setting name="BasicTextControls" serializeAs="String">
<value>
```

```
<BasicTextControls>

  <ProcessName name="Process_1">
    <WindowClass>Sample_class_1</WindowClass>
  </ProcessName>

  <ProcessName name="Process_2">
  </ProcessName>

  <ProcessName name="*">
    <WindowClass>Sample_class_2</WindowClass>
    <WindowClass>Sample_class_3</WindowClass>
  </ProcessName>

</BasicTextControls>
</value>
</setting>
```

## Enabling Basic Text Control for Google Chrome

**Note:** The web extension for Dragon Professional Anywhere 2021.3 or higher must be [installed](#).

You can enable dictation at the cursor using Basic Text Control for apps hosted in the Google Chrome browser that aren't fully supported by Dragon Professional Anywhere.

Proceed as follows:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, BasicTextControls** setting, add the chrome attribute in the **ProcessName** element and specify the URLs you want to enable Basic Text Control for in the **UrlTextToMatch** elements. The setting is applied to any URL containing the value specified in the **UrlTextToMatch** element.

Example:

```
<setting name="BasicTextControls" serializeAs="String">

<value>
  <BasicTextControls>

    <ProcessName name="chrome">
      <UrlTextToMatch>financial</UrlTextToMatch>
    </ProcessName>

  </BasicTextControls>
</value>
</setting>
```

Basic Text Control is enabled for any URL containing financial. For example, `https://your.financial.web.application.com`, `https://financial.services.com` or `https://financial.data.com`.

## Configuring the text transfer method for text controls that Basic Text Control is enabled for

By default, the text is inserted in the text controls via `SimulateKeystrokes`; other possible text transfer methods are `ShiftInsert`, `CtrlV` and `WindowsPaste`. Dragon Professional Anywhere enables you to configure the text transfer method for all text controls of a process or for specific text controls.

Proceed as follows:

1. Open the app configuration file that the app should use (for example, `SoD.exe.configuration` on your web server or `SoD.exe.config` for the standalone package).
2. In the **SoD.Settings, BasicTextControls** setting, configure the text transfer method:

To apply the setting to all window classes of the process, add the `textTransferMethod` attribute in the **ProcessName** element and set the value. To apply the setting on a window class level, add the `textTransferMethod` attribute in the **WindowClass** element and set the value. The attribute that you set in the **WindowClass** element overrides the **ProcessName** text transfer method.

Example:

```
<setting name="BasicTextControls" serializeAs="String">
  <value>
    <BasicTextControls>

      <ProcessName name="*" textTransferMethod="ShiftInsert">
        <WindowClass textTransferMethod="SimulateKeystrokes">Sample_class_2</WindowClass>
        <WindowClass>Sample_class_3</WindowClass>
      </ProcessName>

      <ProcessName name="Process_1">
        <WindowClass textTransferMethod="CtrlV">Sample_class_1</WindowClass>
      </ProcessName>

      <ProcessName name="chrome" textTransferMethod="ShiftInsert">>
        <UrlTextToMatch>your.web.application</UrlTextToMatch>
      </ProcessName>

    </BasicTextControls>
  </value>
</setting>
```

&lt;/setting&gt;

## Configuring timeout for end users

You can configure Dragon Professional Anywhere to automatically log a user off if they haven't worked with the app for the specified period of time. When a user is logged off automatically, any unsaved changes are lost.

By default, this setting is empty and a user is never logged off automatically, no matter how long they don't use Dragon Professional Anywhere.

Proceed as follows:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, AutoLogOffTimeout** setting, set the time period in minutes. Range: 5-120 minutes.

Example:

```
<setting name="AutoLogOffTimeout" serializeAs="String">  
  <value>10</value>  
</setting>
```

If the user doesn't work with Dragon Professional Anywhere for more than 10 minutes, they're logged off.

## Configuring the language

You can configure the language used for speech recognition and the user interface. Proceed as follows:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, SupportedLanguages** setting, specify the language as an IETF language tag.

If you specify a language that is only available for speech recognition, the user interface is displayed in a related language.

If you want to present a list of available languages to the end user, specify all supported languages in the setting and separate them with the pipe (|) character (for example, en-US|en-

GB|de-DE). The end user can then choose one of the specified languages when they start the app.

**Note:** You can provide multiple download links to enable your users to choose a language.

For more information, see: [Supported languages](#).

## Configuring the speech recognition topic/specialty

To configure the speech recognition topic for Dragon Professional Anywhere, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, SupportedTopics** setting, specify the speech recognition topic.

If you want to present a list of available speech recognition topics to the end user, specify all supported speech recognition topics in the setting and separate them with the pipe (|) character (for example, GeneralDictation|LawEnforcement). The end user is then able to choose a topic when they start the app.

### Supported speech recognition topics

The following topics are available:

GeneralDictation, LawEnforcement.

## Configuring microphones

To configure the microphones the end user is allowed to use in Dragon Professional Anywhere, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, AllowedMicrophones** setting, specify all microphones the end user is allowed to use and separate them with the pipe (|) character.

When the end user starts the app, the list of connected microphones is filtered based on this setting. If you don't configure this setting, the end user can choose from all connected microphones.

## Disabling the crash dump notification to end users

When Dragon Professional Anywhere shuts down unexpectedly, crash dump information is saved. The next time the user starts the app, they're informed that log files containing information about the crash are available and can be sent to their system administrator for analysis.

We recommend that you ask your users to send crash dump files to you; send the files, along with an error report if possible, to Nuance Technical Support for further analysis.

If you do not want your users to receive this crash dump notification, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, EnableCrashNotification** setting, set the value to False.

## Disabling registration of the Microsoft Word add-in

When starting, Dragon Professional Anywhere calls the regsvr32.exe executable to register the Microsoft Word add-in. To disable registration of the Microsoft Word add-in, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings**, add the setting **RegisterWordAddIn** and specify as follows:

```
<setting name="RegisterWordAddIn" serializeAs="String">  
  <value>False</value>  
</setting>
```

**Note:** This configuration setting is optional.

## Registering the Microsoft Word add-in for individual users

If registration of the Microsoft Word add-in is disabled, you can enable it for an individual user. Log on to the corresponding user account and run the following command:

```
regsvr32.exe /s SoD.WordAddin.dll
```

If a user works with a 64-bit version of Microsoft Word, run the following command:

```
regsvr32.exe /s SoD.WordAddin_x64.dll
```

**Note:** If you update Dragon Professional Anywhere, you must run the corresponding command again.

## Customizing the splash screen

You can lay a custom image over the Dragon Professional Anywhere splash screen; the overlay image is placed in the lower left corner of the splash screen.

Requirements:

Size: 320x130 pixels

Format: PNG

File name: SoD.OEM.png

Location:

Standalone: The app directory (same location as the configuration file)

## Configuring the user interface color theme

The color theme for Dragon Professional Anywhere can be one of the following:

- Blue: Default color theme, used when this setting is empty.
- Light / Dark: Monochrome color themes with high contrast.
- System: Follows the monochrome color theme set in Microsoft Windows under **Choose your default app mode**.

To configure the color theme, do the following:

1. Open the app configuration file that the app should use (for example, SoD.exe.configuration on your web server or SoD.exe.config for the standalone package).
2. In the **SoD.Settings, DefaultTheme** setting, specify the color theme, for example:

```
<setting name="DefaultTheme" serializeAs="String">  
  <value>Light</value>  
</setting>
```

# Dragon Professional Anywhere command line

## Starting Dragon Professional Anywhere from the command line

You can configure the standalone Dragon Professional Anywhere package so that your users don't need to log on separately to the app. By starting Dragon Professional Anywhere with the mandatory parameters specified, the logon dialog box is not displayed and any logged on user is automatically logged off.

**Note:** Make sure you specify the full path to the app, not just the short 8.3 form .

### Example

Chris Smith speaks with an American English accent, works as a business lawyer and records using a SpeechMike III.

```
SoD.exe -user "chrissmith" -lang "en-US" -topic "GeneralDictation" -mic "SpeechMike  
III"
```

When Chris Smith logs on to a PC, Dragon Professional Anywhere is available, in the notification area, with their preferred settings applied.

### Parameters

#### user

The speech recognition user profile name.

This parameter is mandatory; you must specify the user before any of the other parameters are applied.

If [trusted authentication](#) is enabled, this parameter is ignored.

#### lang

The speech recognition language. This parameter is optional.

Specify the language as an IETF language tag. For more information, see: [Supported languages](#).

If only one language is specified in the configuration file and this parameter isn't set, this language is selected automatically and Dragon Professional Anywhere starts without displaying the logon dialog box.

If more than one language is specified in the configuration file and this parameter isn't set, Dragon Professional Anywhere starts without displaying the logon dialog box and uses the language the user last logged on with. If the user hasn't logged on successfully before, or if the language the user last logged on with is no longer available, the logon dialog box is displayed and the user must select a language manually.

#### topic

The speech recognition topic (specialty). For a list of available topic names, see:

[Configuring the speech recognition topic](#).

If only one topic is specified in the configuration file and this parameter isn't set, this topic is selected automatically and Dragon Professional Anywhere starts without displaying the logon dialog box.

If more than one topic is specified in the configuration file and this parameter isn't set, Dragon Professional Anywhere starts without displaying the logon dialog box and uses the topic the user last logged on with. If the user hasn't logged on successfully before, or if the topic the user last logged on with is no longer available, the logon dialog box is displayed and the user must select a topic manually.

#### mic

The microphone identifier.

This parameter is mandatory. If you don't know the exact microphone identifier, you can specify part of the name, for example, "SpeechMike". If only one connected microphone contains the specified string in its name, this microphone is used. If no connected microphone or more than one connected microphone contains the specified string in its name, the logon dialog box is displayed and the user must select a microphone.

If you have configured a list of [allowed microphones](#), the `mic` parameter is optional.

Dragon Professional Anywhere goes through the allowed microphones, in the order that you listed them, and uses the first specified microphone it finds that is connected. If you specify the `mic` parameter, the specified microphone must be included in the list of allowed microphones.

#### password

The user's password.

If [trusted authentication](#) is enabled, this parameter is ignored.

#### nologo

Disables the splash screen.

#### config

The path to the XML file containing custom configuration settings. For more information, see: [Configuring Dragon Professional Anywhere](#).

## Logging off and closing Dragon Professional Anywhere from the command line

You can configure the standalone Dragon Professional Anywhere package so that your users don't need to log off or close the app manually.

### Parameters

#### logoff

Logs off the currently logged on user. This parameter is exclusive and can't be used together with other parameters.

If [trusted authentication](#) is enabled, this parameter is ignored.

#### shutdown

Shuts down the currently running instance of Dragon Professional Anywhere. This parameter is exclusive and can't be used together with other parameters.

## Enabling and disabling WPF support from the command line

Dragon Professional Anywhere provides built-in support for apps based on Windows Presentation Foundation (WPF) TextBox class text controls. You need to enable WPF only if your users can't dictate at the cursor in these apps.

You can enable/disable WPF support, for a specific machine, in the standalone Dragon Professional Anywhere package. By enabling/disabling WPF support, you register/deregister a Microsoft Text Services Framework plugin on the machine that you have deployed to. This operation requires administration rights on that machine. To perform the registration, Dragon Professional Anywhere attempts to elevate rights; if the rights cannot be elevated you cannot proceed.

**Note:** regsvr32.exe is invoked for this operation.

These parameters are mutually exclusive and override any other parameters passed to the SoD.exe process during start-up. For example, passing the parameters during standard logon

procedure isn't supported and causes Dragon Professional Anywhere to shut down after registration/deregistration.

## Parameters

### `enableWPF`

Registers the Text Services Framework (TSF) plugin. To perform the registration, the `SoD.exe` process is started, and once this operation is performed, it shuts down.

You only need to enable WPF support once per deployment or if you change the deployment location.

### `disableWPF`

Deregisters the Text Services Framework (TSF) plugin. To perform the deregistration, the `SoD.exe` process is started, and once this operation is performed, it shuts down.

# Nuance Management Center - overview

The Nuance Management Center (NMC) is the central administration component for Dragon Professional Anywhere. NMC enables you to perform a variety of administration tasks, such as licensing and managing auto-texts, users, groups and organizations.

For information on how to define auto-texts in NMC, see: [Auto-texts](#).

## Prerequisites for running NMC

- Microsoft Edge, Google Chrome, Apple Safari
- Microsoft .NET Framework 4.7.1

**Note:** NMC requires HTTP access to port 80 or HTTPS access to port 443; make sure your firewall doesn't block these ports. These ports must be accessible from the workstations used to access NMC.

## Launching NMC

1. To access NMC, go to: `http(s)://<your.NMS.server>/nmhtml`.
2. To log on for the first time, use the following credentials:

**User Login:** admin

**Password:** password

**Note:** To change your password, select  > **Change password**.

For more information on NMC, select  in the upper right of the NMC page to open the *Nuance Management Center Help*.

## Licensing

To monitor licenses and see a summary of license information, open the **Licensing** ribbon, select **View Licenses** and search for the license type.

If [auto-provisioning](#) is enabled, user accounts are automatically created and licenses are assigned. If auto-provisioning is disabled, this must be done manually. To assign a license to a user account, do the following:

1. On the **Licensing** ribbon, select **View Licenses**.
2. Select **Search**; all licenses are displayed.
3. Select the license that you want to assign to the user and select **Grant**.
4. Select the user account from the list of **Available Users** and select **OK**.

To revoke a license, do the following:

1. On the **Licensing** ribbon, select **View Licenses**.
2. Select **Search**; all licenses are displayed.
3. Select the license that you want to revoke and select **Revoke**.
4. Select the user account from the list of **Available Users** and select **OK**.

## Users

### Auto-provisioning

Auto-provisioning is enabled by default. This means that the first time a user connects to Dragon Professional Anywhere, a user account is automatically created and a license is assigned. If no more licenses are available, a user account is created but the user won't be able to use speech recognition.

User accounts that are generated automatically are assigned to the **Dragon Medical** group; their first name in the system is *<Generated>*. To add a user account to another group, open the **Group Memberships** tab on the **User Account Details** page; use the arrow buttons to assign and organize the groups the user account is assigned to.

We recommend keeping auto-provisioning enabled; however, creating accounts manually enables you to enter more information for each user (for example, location and department) and control license allocation.

To disable auto-provisioning, do the following:

1. On the **Sites** ribbon, select **Organization Overview > Details**.
2. On the **Provisioning** tab, select **Dragon Medical Server > None > Save**.

To disable automatic license assignment, do the following:

1. On the **Sites** ribbon, select **Organization Overview > Details**.
2. Onn the **Provisioning** tab, select **Dragon Medical Server**.
3. Activate **Restrict automatic license assignment to specific license types**; to keep automatic license assignment enabled for specific license types, use the arrow buttons to move license types from **Automatic license assignment disabled** to **Automatic license assignment enabled**.
4. Optionally, activate **Enable automatic license assignment for newly imported license types**.

## Creating user accounts

To create a user account, do the following:

1. On the **User Accounts** ribbon, select **Add**.
2. On the **User Account Details** page, enter the **First name**, **Last name** and **Login**; the other fields are optional.  
If you use [native authentication](#), enter the **Primary email address** to enable users to reset their password if they forget it; instructions on how to reset the password are sent to the specified email address.
3. On the **Group Memberships** tab, assign the user account to at least one group. If you aren't currently working with groups, assign the user account to the **Dragon Medical** group.
4. Select **Save** and select the license that you want to assign to the user in the **Licenses** dialog box, or select **Save & New** (to create another user account).

## Viewing user account information

To view a list of users, do the following:

1. On the **User Accounts** ribbon, select **Search**.
2. Select an **Organization** and enter search criteria. If you don't enter any search criteria, all users in the organization are displayed.

To view a report of client versions used in your Dragon Medical system, do the following:

1. On the **Reports** ribbon and select **Client Version**.
2. Enter search criteria and select **Search**.
3. To export the results as a CSV file, select  .

## Resetting user profiles

Resetting a user profile might be necessary when a user's role or environment changes significantly; for example, a doctor moves to an administrative role or a user moves from an environment with a lot of background noise to a quiet environment. The adaptation process can improve speech recognition quality faster after the user profile has been reset.

To reset a user profile, do the following:

1. On the **User Account Details** page, open the **User Profile** tab.
2. Select **Dragon Medical Server > Reset speech recognition user profile > Save**.

Be careful when resetting a user profile; this action has the following consequences:

- The user profile must be readapted to the user's voice; this has a short-term impact on speech recognition quality.
- Words previously added to the vocabulary by the user aren't available immediately after resetting the user profile. It can take up to a few minutes of dictation for words previously added to the vocabulary to be available again.
- The user can't add or edit words until all words previously added to the vocabulary become available again.

**Note:** The user vocabulary isn't reset when you reset a user profile. Any words added or disabled by the user remain added or disabled.

## Groups

When you first log on to NMC the following groups are available:

- **NMC Administration:** For users performing administration tasks in NMC.
- **Dragon Medical:** For users accessing speech recognition.

**Note:** The **Dragon Medical** group doesn't exist until the first end user connects via a Dragon Professional Anywhere client; the group is then automatically created.

## Working with groups

Groups are useful for the following:

- To assign the rights to create auto-texts to specific users.
- To make certain auto-texts available to specific users. To assign an auto-text to a group, make sure that the **Group** level is selected when you [create the auto-text](#).

To group users who have the rights to create auto-texts, do the following:

1. Log on to NMC with your administration credentials.
2. On the **Groups** ribbon, select **Add**.
3. Select the new group's organization.
4. In the **Role** field, select **NMC Administrator**.
5. Base the new group on the existing **NMC Administration** group and select **OK**.
6. Enter a **Group name** and make sure the correct **Site** is selected.
7. In the **Privileges** list, select **Product Manage Dragon Medical Server**.
8. Select **Save**.
9. On the **Groups** ribbon, select **Search**.
10. Enter the name of the group you just created and select it in the list of search results.
11. Select **Add User Account to Group** in the **Membership** ribbon.
12. To add a user account to the group, enable the check box in the **Member** column in the corresponding row.
13. Select **Save**.

To group users of auto-texts, do the following:

1. Log on to NMC with your administration credentials.
2. On the **Groups** ribbon, select **Add**.
3. Select the new group's organization.
4. In the **Role** field, select **Speech Recognition User** and select **OK**.

5. Enter a **Group name** and make sure the correct **Site** is selected.
6. Select **Save**.
7. On the **Groups** ribbon, select **Search**.
8. Enter the name of the group you just created and select it in the list of search results.
9. Select **Add User Account to Group** in the **Membership** ribbon.
10. To add a user account to the group, enable the check box in the **Member** column in the corresponding row.
11. Select **Save**.

# Logging

Dragon Professional Anywhere creates log files that can help Nuance analyze issues reported by end users or administrators. Log files are uploaded to Dragon Medical Server, and a limited amount of information is written to the local file system of the client PC. The information written to the local file system does not contain any sensitive data; the amount of data kept on the local PC can be configured and usually spans data for the last few days.

## Log file location

### Dragon Medical Server

Dragon Medical Server log file: \\<server\_name>\<share>\Logs\<year\_month>\<day>\

Dragon Medical SpeechKit log file: \\<server\_name>\<share>\Logs\<year\_month>\<day>\

### Local PC

Local log file (doesn't contain sensitive data):

Dragon Professional Anywhere standalone directory

Crash dump:

%APPDATA%\Nuance\SoD\

### Virtual desktop/application environment

For information on logging in a virtual desktop/application environment, see: [Logging in a virtual environment](#).

## Setting the logging level

The log level is set in the log4net section of the configuration file (SoD.exe.configuration on your web server or SoD.exe.config for the standalone package). The log level should be set for both logger names specified in the configuration section:

```
<logger name="Nuance.SoD.Generic">  
<logger name="Nuance.SoD.Text">
```

The default log level is **ERROR** which creates the least amount of data. You can change the logging level to one of the following (amount of data collected in descending order):

DEBUG  
INFO  
WARN  
ERROR

# User authentication

The following options are available for user authentication in Dragon Professional Anywhere:

- **No authentication:** The user enters a unique user name and must always use this name; a password isn't required.
- **Native authentication:** The user must enter a user name and password provided by the administrator. The credentials are checked via the Nuance Management Server (NMS).
- **LDAP authentication:** The user must enter a user name and password, and the credentials are checked via an LDAP server.
- **Trusted authentication:** The user, logged on to Microsoft Windows with their Active Directory user name and password, is automatically logged on to Dragon Professional Anywhere. The credentials are checked via the Nuance Management Server (NMS).

## No authentication

Dragon Professional Anywhere prompts the user to enter a new user name when logging on for the first time; using a password is not possible. NMS automatically creates a user profile if a profile for the user name doesn't exist. The user is granted access to Dragon Professional Anywhere and a license is assigned. The user must enter the same user name every time they log on to Dragon Professional Anywhere.

### Procedure

In the app configuration file (for example, SoD.exe.configuration on your web server or SoD.exe.config for the stand-alone package), **SoD.Settings, Authentication** setting, specify: `<value>none</value>`.

## Native authentication

This is the default configuration for authentication. You must create a user account in NMC before the user can log on to Dragon Professional Anywhere. The user enters the user name and password provided by the administrator, and the credentials are sent to NMS for authentication.

**Note:** To enable users to reset their password if they forget it, make sure you provide their primary email address when you create the user accounts in NMC; for more information, see: [Creating user accounts](#).

## Procedure

In the app configuration file (for example, SoD.exe.configuration on your web server or SoD.exe.config for the stand-alone package), **SoD.Settings, Authentication** setting, specify: `<value>native</value>`.

## Configuring password settings in NMC

To define password expiration and complexity criteria for users of an organization, do the following:

1. Search for the organization, select and hold (or right-click) it and select **Details**.
2. On the **Products** tab, open the **General** tab and expand **Password Settings**.
3. Define the criteria.
4. Select **Password must meet complexity requirements**.
5. Select **Save**.

## LDAP authentication

When Dragon Professional Anywhere is started, users must enter their Windows user name and password. The credentials are sent to NMS to authenticate against an LDAP server.

## Prerequisites

- Dragon Medical Server must be installed and running properly.
- NMS must be installed and running properly.
- The Dragon Medical Recognition Service must not run under an administrator account; make sure the Dragon Medical Recognition Service user account fulfills the requirements but is not an administrator account.
- In the domain controller:

A valid user account must be set up (this is the user account configured in NMS and used to log on to Dragon Professional Anywhere).

The guest account must be disabled.

- Make sure you have the following information at hand:

Dragon Medical Server URL

Nuance Management Center (NMC) URL

Active Directory connection string as follows:

Secure LDAP authentication - LDAP://<your\_LDAP\_server>:636

Non-secure LDAP authentication - LDAP://<your\_LDAP\_server>

Domain name

## Configuring the domain and user accounts

You must configure the domain and the user accounts in NMC to authenticate users in the Active Directory.

To configure a domain, do the following:

1. Search for the organization, select and hold (or right-click) it and select **Details**.
2. On the **Domains** tab, select **Add**.
3. Enter the domain name and the Active Directory connection string.
4. Select **Save**.

To configure a user account, do the following:

1. Search for the user account, select and hold (or right-click) it and select **User Account Details**.
2. Open the **Credentials** tab.
3. On the **NTLM** tab, select **Add**; the **User name** and **Organization Name** are already filled out.
4. From the **Domain** list, select the user's domain.
5. In the **Login** field, enter the LDAP login ID.
6. Select **Save**.

## Configuring Dragon Professional Anywhere

In the app configuration file (for example, SoD.exe.configuration on your web server or SoD.exe.config for the stand-alone package), **SoD.Settings, Authentication** setting, specify: <value>ldap</value>.

## Trusted authentication

The Active Directory credentials of the user currently logged on to Microsoft Windows are sent to NMS for authentication. The user can work with Dragon Professional Anywhere without entering a user name and password; the logon dialog box is not displayed.

### Configuring Dragon Professional Anywhere

In the app configuration file (for example, SoD.exe.configuration on your web server or SoD.exe.config for the stand-alone package), **SoD.Settings, Authentication** setting, specify: `<value>trusted</value>`.

### Configuring user accounts in NMC

To configure a user account for authentication in the Active Directory, do the following:

1. Search for the user account, select and hold (or right-click) it and select **User Account Details**.
2. Open the **Credentials** tab.
3. On the **NTLM** tab, select **Add**; the **User name** and **Organization Name** are already filled out.
4. From the **Domain** list, select the user's domain.
5. In the **Login** field, enter the Active Directory login ID.
6. Select **Save**.

# Speech recognition settings: Auto-texts

The auto-text feature enables you to define standard blocks of text that Dragon Professional Anywhere users can insert into their document with a short voice command. Using auto-texts reduces the time the user needs to dictate and improves the consistency of documentation. Available auto-texts are displayed to end users on the **What You Can Say** page. You define auto-texts in the Nuance Management Center (NMC). Users can create their own auto-texts in Dragon Professional Anywhere in the **Manage Auto-texts** dialog box.

## Defining an auto-text in NMC

### Scenario

- You define an auto-text for an email signature line called *Signature* that contains this information:  
  
Chris Smith  
Executive Vice President and Director  
Automobile Manufacturing Company  
Chris.Smith@AMC.com
- Your user says the voice command **signature** to insert the information.

### Procedure

1. On the **Speech Recognition** ribbon, select **Manage**.
2. Select your **Organization**.
3. Expand the **Auto-texts** node in the tree view and select the level you want to create the auto-text for (site, group or user).
4. Select and hold (or right-click) the level and select **Add Auto-text**.
5. Enter a **Name** (*Signature*), a **Description** (optional) and select a **Language**.
6. Optional: change the **Spoken Phrase**.
7. In the contents section, enter:

*Chris Smith*  
*Executive Vice President and Director*

*Automobile Manufacturing Company  
Chris.Smith@AMC.com*

8. Select **Save**.

## Name

The **Name** field contains the title of the auto-text (this is generally what users must say to insert the auto-text); make sure it is unambiguous and easy to pronounce. It's strongly recommended that you give the auto-text a distinctive name that can't be misinterpreted as speech to be recognized. This helps to ensure that it is correctly inserted.

You can't create two auto-texts with the same name, even if different spoken phrases are defined.

You can't create two auto-texts with the same spoken phrase, even if different names are defined.

## Spoken phrase

By default, the **Spoken Phrase** is the same as the **Name**. If how the auto-text name is written and how it's pronounced are very different, change the **Spoken Phrase** (how it's pronounced). If you want to give your users more than one way to insert an auto-text, select  and enter another **Spoken Phrase**.

When you enter a spoken phrase, follow these rules:

- Use alphabetic characters only. Don't use:
  - Digits (for example, use 'twelve' instead of '12') unless they're part of common words (for example, use '3D' instead of 'three D').
  - Punctuation marks (for example, ., ", ! or ?).
  - Symbols (for example, +, & or \$) except for hyphens used in compound words (for example, 'C-spine').
- Follow standard capitalization rules (for example, use capital letters for proper names).
- Avoid using capital letters (except for acronyms or if the standard capitalization rules require it, see above).
- For acronyms that are spelled out, use capital letters (for example, CIA); if they're not recognized, separate the capital letters by spaces (for example, C I A).
- For acronyms that are pronounced as words, use lowercase (for example, use 'pet CT' for 'PETCT' or 'pick' for 'PICC').
- Don't use very short names that are acoustically difficult to capture (such as one syllable only).

- Use full words instead of abbreviations (for example, use 'without' instead of 'wo').
- Check for typos.

## Fields

Auto-texts can contain fields. Fields are gaps in the auto-text where users can enter specific text, for example, client data.

To add a field to an auto-text, enter [ ] in the relevant place of the auto-text's contents; you can enter any text between the field delimiters as default content, for example, **Client plea [not guilty]**. When users insert the auto-text, they can decide whether they want to replace the default values with specific text or use the default values.

By default, fields are indicated by square brackets. Users can change the characters used as field delimiters in Dragon Professional Anywhere on the **General** pane of the **Options** dialog box; any previously defined fields using different delimiters no longer work then.

## Remarks

- To make the auto-text available for specific users, make sure to select the corresponding site or group in the tree view.
- Actions on the group level (for example, deleting an auto-text) override those on the site level. Actions on the user account level override group and site levels.
- A keyword is what the user says to tell the system that an auto-text is to be processed. You can [configure a keyword in NMC](#).
- Activate **Display all levels** to list the auto-texts for the level selected in the tree view and its higher levels.

# Defining a keyword in NMC

## Scenario

- You define the keyword: **insert**.
- When the user says **insert**, the system identifies that an auto-text is to be processed and displayed.

## Procedure

1. On the **Speech Recognition** ribbon, select **Keywords**.
2. Select your **Organization** and enter *insert* as the **Leading Keyword** for English.
3. Select **OK** to save your settings.

## Remarks

- You can define a leading keyword (said before the spoken phrase) and/or a trailing keyword (said after the spoken phrase).
- Keyword changes are applied to all auto-texts defined in your organization.
- The maximum number of characters for a keyword is 25.
- You can only use alphabetic characters in keywords; as for spoken phrases, special characters are not allowed

# Speech recognition settings: Voice commands

Voice commands enable Dragon Professional Anywhere users to say a word or phrase that initiates an action and control the app without using the mouse or the keyboard. This reduces the time the user needs to complete their work.

The custom command feature in Dragon Professional Anywhere was extended to enable users to create more feature-rich commands, they're now called step-by-step commands. Users define step-by-step commands in the **Manage Step-by-step Commands** dialog box and they're displayed on the **What You Can Say** page; for more information, see the end user help.

Existing user-level custom commands created in the Nuance Management Center are automatically migrated to step-by-step commands.

# Speech recognition settings: Managing the vocabulary

Managing the vocabulary your users are using enables you to improve speech recognition by explicitly tailoring the system to your requirements. This might be necessary if words or phrases are repeatedly misrecognized.

In the Nuance Management Center (NMC), you can add words and phrases to the vocabulary or delete existing words and phrases from it.

For more information on NMC, select  in the upper right of the NMC page to open the *Nuance Management Center Help*.

## Adding a word in NMC

### Scenario

Your users frequently dictate *voir dire* and recognition is problematic.

### Procedure

1. On the **Speech Recognition** ribbon, select **Manage**.
2. Expand the **Words** node in the tree view and select the level you want to associate the word with (site, group or user).
3. Select and hold (or right-click) the level and select **Add Word**.
4. Enter a **Written form** (*voir dire*) and, if necessary, a **Spoken form** (*vwar deer*).
5. Select the **Language** you want to associate the word with.
6. Select **Save**.

### Spoken form

The spoken form is optional. If how the word is written and how it's pronounced are very different, enter a spoken form (how it's pronounced) and define a **Written form** (how it's inserted into the document).

Two words with the same written form but different spoken forms are treated as separate words.

Two words with different written forms but the same spoken form are treated as separate words.

When you enter a spoken form, follow these rules:

- Use alphabetic characters only. Don't use:
  - Digits (for example, use 'twelve' instead of '12') unless they're part of common words (for example, use '3D' instead of 'three D').
  - Punctuation marks (for example, ., ", ! or ?).
  - Symbols (for example, +, & or \$) except for hyphens used in compound words (for example, 'C-spine').
- Follow standard capitalization rules (for example, use capital letters for proper names).
- Avoid using capital letters (except for acronyms or if the standard capitalization rules require it, see above).
- For acronyms that are spelled out, use capital letters (for example, CIA); if they're not recognized, separate the capital letters by spaces (for example, C I A).
- For acronyms that are pronounced as words, use lowercase (for example, use 'pet CT' for 'PETCT' or 'pick' for 'PICC').
- Don't use very short names that are acoustically difficult to capture (such as one syllable only).
- Use full words instead of abbreviations (for example, use 'without' instead of 'wo').
- Check for typos.

## Remarks

- To make the word available for specific users, select the corresponding site or group in the tree view.
- Actions on the group level (for example, deleting a word) override those on the site level. Actions on the user account level override group and site levels.
- Words can only occur once within a site, group or user account, but the same word can occur in different entities on the same level (for example, two groups) or on different levels (group and user of that group).
- Activate **Display all levels** to list the words that have been added for the level selected in the tree view and its higher levels.

## Searching for words in NMC

To view the list of words associated with a user, group or site, do the following:

1. On the **Speech Recognition** ribbon, select **Manage**.
2. Expand the **Words** node in the tree view and select a level (site, group or user).

## Importing words

To add multiple words it can be convenient to import a text file. To import a list of words for a specific site, group or user account, do the following:

1. Create a text file containing the list of words to add, with each word on a new line.  
Optional: Type the spoken form after the written form on the same line, separated by two backslashes; for example: voir dire\\vwar deer.
2. On the **Speech Recognition** ribbon, select **Import**.
3. Follow the **Import Words** wizard. You can select words to add from your text file and select the specific site, group or user account to associate them with.

# Documentation

Dragon Professional Anywhere is delivered with documentation for system administrators and end users.

## System administrators

The *Dragon Professional Anywhere Installation and Administration Guide* describes the installation and system configuration procedures. This guide also covers information on the Nuance Management Center.

The *Dragon Medical Server Installation Guide* describes the installation procedures, and the *Dragon Medical Server Administration Guide* describes the system configuration procedures for Dragon Medical Server. These guides also cover information on the Nuance Management Center.

## End users

Users access the end user help by saying **launch help** or by selecting **Help** on the DragonBar menu. The **Dragon Help** tab of the personalization and help window contains information on how to use the app features (for example, anchoring the speech focus); the **Speech Recognition Help** tab contains information on speech recognition features and how to use them.

The **What You Can Say** page contains a list of all available voice commands and auto-texts. Users can open it by saying **what can I say** or selecting **What You Can Say** on the DragonBar menu.

# Supported languages

The speech recognition language is the language the user records in and that Dragon Professional Anywhere recognizes.

The user interface language is the language in which Dragon Professional Anywhere displays menus, error messages and dialog boxes.

Which languages are supported in your organization depends on your region and your Dragon Professional Anywhere license; for more information, contact Nuance Technical Support or your Nuance account executive.

# Troubleshooting

- After Dragon Professional Anywhere has been deployed via [XCOPY deployment](#), the app doesn't start and an exception is thrown:  
"System.Configuration.ConfigurationErrorsException: Insufficient permissions for setting the configuration section 'defaultProxy'. ---> System.Security.SecurityException: Request for the permission of type 'System.Net.WebPermission, System, Version=4.0.0.0, Culture=neutral, PublicKeyToken=b77a5c561934e089' failed."  
  
Depending on your Group Policy security settings, Microsoft Windows marks downloaded files as unsafe. This prevents .NET from executing properly, which causes the exception.  
Unblock the downloaded ZIP file before you extract it; for more information, see: [XCOPY deployment](#).
- Dragon Professional Anywhere crashes when the app is started.  
  
Check the [configuration file](#) and the [log file](#) for configuration-related issues.  
Make sure that your system conforms to the [software and hardware requirements](#).  
Make sure you followed all steps required to [set up a working system](#).
- An error occurs when Dragon Professional Anywhere is started: **An error has occurred, it is not possible to use the application. Please contact your administrator. The specified server URL cannot be reached, check your network connection.**  
  
Check the [Dragon Medical Server URL](#) in the configuration file.  
On Dragon Medical Server, make sure that the Dragon Medical Recognition Service is running.  
Check the network connection to Dragon Medical Server.
- The automatic gain control (AGC) of the recording device or the device driver/sound card driver interferes with the automatic audio adjustment feature of Dragon Professional Anywhere.  
  
Disable the interfering AGC.
- An error occurs when the user starts recording: **Speech recognition is temporarily not available in this application because there are no licenses available.**  
  
If auto-provisioning of users isn't enabled for your organization in NMC, make sure that the user exists in NMC and the user name is spelled correctly (user names are case-sensitive), and that the user's token credentials (**User Account Details** page, **Credentials** tab, **Token** tab) are the same as the user name or empty.  
In NMC, check if your organization has run out of licenses. For more information, see [Licensing](#).

- Dragon Professional Anywhere inserts text in the wrong place in a Microsoft Word document.

This might be caused by a version incompatibility. Make sure you use a Microsoft Word version officially supported by Dragon Professional Anywhere. For more information, see: [Software and hardware requirements](#).

- Incorrect text is transferred when the user dictates at the cursor using Basic Text Control.

In the Dragon Professional Anywhere configuration file, **SoD.Settings** element, add the following setting to keep the text on the user's clipboard after transfer:

```
<setting name="BasicTextKeepTextOnClipboardAfterTransfer"
serializeAs="String">
    <value>True</value>
</setting>
```

- The user changed their settings in the **Options** dialog box, but the changes aren't saved.

Make sure that Dragon Professional Anywhere can communicate with the Nuance Management Server; for information on the ports Dragon Professional Anywhere requires access to, see: [Setting up a working system](#).

- An error occurs when Dragon Professional Anywhere is started: **No supported audio device is available. To start Dragon, connect a device and select Refresh.**

Connect a [microphone the end user is allowed to use](#) and select **Refresh**.

In a virtual desktop/application environment, make sure the connected microphone is set as the default device in Microsoft Windows on the end point.

In a virtual desktop/application environment, make sure the [Nuance custom audio channel](#) has been deployed on the client end point and on the virtual server hosting the app.

- Dragon Professional Anywhere shuts down unexpectedly; no error message is displayed.

Collect the crash dump (location: %APPDATA%\Nuance\SoD\) and send it, along with an error report if possible, to Nuance Technical Support for analysis.

- A message is displayed when the user opens the personalization and help window: **Software update required. Starting in January 2022, this application requires Microsoft WebView2. For more information, contact your administrator.**

Install the Microsoft Edge WebView2 Evergreen Standalone component; for more information, see [WebView2 - Microsoft Edge Developer](#).

- In a Citrix environment, the personalization and help window isn't displayed properly or closes unexpectedly with an error message.

Disable the Citrix 'special folder redirection' setting for the Microsoft Edge WebView2 runtime process. To do so, add the following registry keys to your Citrix environment configuration:

```
[HKEY_LOCAL_MACHINE\SOFTWARE\Citrix\CtxHook\AppInit_  
DLLs\SfrHook\msedgewebview2.exe]  
[HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\Citrix\CtxHook\AppInit_  
DLLs\SfrHook\msedgewebview2.exe]
```

For more information, see the Citrix documentation on [how to disable Citrix API hooks on a per-application basis](#).

- The user can't dictate at the cursor in apps based on Windows Presentation Foundation (WPF) TextBox class text controls.

Make sure you enable WPF support from the command line. For more information, see: [Enabling and disabling WPF support from the command line](#).

- The user can't switch the speech focus between apps running at the same time in a Citrix environment.

Launch the Citrix Application Experience (CAX) Troubleshooting Tool on the Citrix server where the issue occurs and deselect all the settings (do not change the **Disable Active Accessibility Hook (0x00000004)** setting). Restart the server before starting Dragon Professional Anywhere. For more information on how to use the troubleshooting tool, see [the Citrix Knowledge Base](#).
